Avalanche.report

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger ↗
on Monday 31 12 2018

Wind-drifted
snow

Persistent
weak layer

The fresh wind slabs represent the main danger.

As a consequence of wind from northwesterly directions, mostly small wind slabs will form in particular adjacent to ridgelines and in gullies and bowls. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent and the danger is greater. These avalanche prone locations are clearly recognisable to the trained eye. Avalanches can in isolated cases be released in the old snowpack and reach dangerously large size. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls. Maintaining distances between individuals is recommended.

Snowpack

The snowpack will be subject to considerable local variations. The somewhat older wind slabs have settled a little. In steep terrain there is a danger of falling on the hard crust.

Danger Level 1 - Low

Tendency: Increasing avalanche danger
on Monday 31 12 2018

Wind-drifted
snow

2500m

Hardly any snow is lying.

Hardly any increase in avalanche danger as a consequence of fresh snow and strong wind. The fresh and somewhat older wind slabs represent the main danger. The wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls as well as in the high Alpine regions. The avalanche prone locations are rather rare and are easy to recognise. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

Some snow will fall in some localities. From a snow sport perspective, in most cases insufficient snow is lying.
