

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 25 01 2019

Persistent weak layer

Treeline

Wind-drifted snow

Treeline

### Weakly bonded old snow requires caution.

Avalanches can be released in the old snowpack and reach medium size in particular on steep shady slopes. These avalanche prone locations are barely recognisable, even to the trained eye. The avalanche prone locations are to be found in gullies and bowls, and adjacent to ridgelines in all aspects. Backcountry touring and other off-piste activities call for meticulous route selection.

### Snowpack

Faceted weak layers exist in the snowpack especially on steep, rather lightly snow-covered shady slopes. The fresh snow and wind slabs of yesterday are lying on top of a weakly bonded old snowpack in particular on steep shady slopes above approximately 2200 m. Below approximately 2000 m thus far only a little snow is lying.

### Tendency

Moderate, level 2.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 25 01 2019

Wind-drifted  
snow

In all altitude zones from a snow sport perspective, in most cases insufficient snow is lying.

The mostly small wind slabs have bonded quite well with the old snowpack especially on sunny slopes. These are to be found especially adjacent to ridgelines and in gullies and bowls and generally at high altitudes. The avalanche prone locations are rather rare and are easy to recognise. Mostly the avalanches in these locations are small and can be released by large loads. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

Only a little snow is lying on north and northeast facing slopes. Below approximately 1400 m no snow is lying. The snowpack remains generally well bonded.

### Tendency

Low, level 1.
