

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Sunday 24 11 2019

Gliding snow

2600m

Wind-drifted  
snow

2200m

Fresh wind slabs at high altitudes and in high Alpine regions. Gliding avalanches especially on steep grassy slopes.

The fresh wind slabs must be evaluated with care and prudence above approximately 2200 m. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack. On steep grassy slopes more gliding avalanches are possible, especially in the regions with a lot of snow. Caution is to be exercised in areas with glide cracks.

## Snowpack

### Danger patterns

dp 2: gliding snow

dp 6: cold, loose snow and wind

As a consequence of a strong to storm force southerly wind, mostly small wind slabs will form in the vicinity of peaks. Faceted weak layers exist deep in the old snowpack above approximately 2800 m. The old snowpack will be moist at low and intermediate altitudes.

## Tendency

The snow sport conditions outside marked and open pistes are generally favourable.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
 on Sunday 24 11 2019

Fresh wind slabs require caution. Caution is to be exercised in areas with glide cracks.

As a consequence of fresh snow and a strong to storm force southerly wind, sometimes easily released wind slabs will form as the day progresses. They are to be evaluated with care and prudence. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent. Caution is to be exercised in particular adjacent to ridgelines. Individual gliding avalanches are possible, even quite large ones, especially in the regions with a lot of snow below approximately 2600 m. Areas with glide cracks are to be avoided as far as possible.

### Snowpack

**Danger patterns**

dp 2: gliding snow

dp 6: cold, loose snow and wind

In some regions 10 to 20 cm of snow will fall. This applies in particular in the Dolomites, in the Ultental and in the Texel Mountains. The fresh wind slabs are clearly recognisable to the trained eye. They are mostly rather small but can be released easily. The older wind slabs have bonded quite well with the old snowpack. Faceted weak layers exist deep in the old snowpack above approximately 2800 m. The snowpack will be moist at low and intermediate altitudes.

### Tendency

Fresh wind slabs require caution.
