

## Danger Level 3 - Considerable

**Tendency: Decreasing avalanche danger**  
on Sunday 01 12 2019

Wind-drifted  
snow

Treeline

Gliding snow

2400m

Fresh wind slabs above the tree line. Gliding avalanches and snow slides require caution.

As the day progresses the previously small wind slabs will increase in size once again. The avalanche prone locations are to be found in all aspects above the tree line and adjacent to ridgelines and in gullies and bowls in all aspects. The wind slabs can be released easily, even by a single winter sport participant, above the tree line.

Areas with glide cracks are to be avoided as far as possible.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

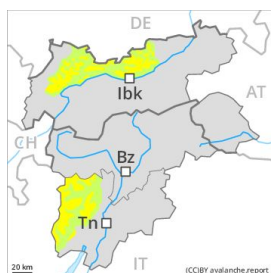

dp 2: gliding snow

Over a wide area 20 to 30 cm of snow, and even more in some localities, fell. Since yesterday the wind has been strong in some regions. At high altitudes and in high Alpine regions the wind was strong to storm force in some cases. As the day progresses the wind slabs have increased in size moderately. The fresh wind slabs are clearly recognisable to the trained eye. They are mostly rather small but can in some cases be released easily. The older wind slabs have bonded well with the old snowpack. The snowpack will be moist below the tree line.

## Tendency

Slight decrease in avalanche danger.

## Danger Level 2 - Moderate

Wind-drifted  
snow

Gliding snow

### Fresh wind slabs require caution.

The fresh wind slabs must be evaluated with care and prudence in all aspects above approximately 2200 m. This applies in particular in gullies and bowls, and behind abrupt changes in the terrain. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent. Individual gliding avalanches are possible, even quite large ones, especially in the regions with a lot of snow below approximately 2600 m. Areas with glide cracks are to be avoided as far as possible.

### Snowpack

#### Danger patterns

dp 6: cold, loose snow and wind

dp 2: gliding snow

In some localities up to 10 cm of snow fell, in particular in the northwest and in the north. At high altitudes and in high Alpine regions the wind was strong to storm force in some cases. The fresh wind slabs are clearly recognisable to the trained eye. The rather small wind slabs are lying on soft layers. They can in some cases be released easily. The older wind slabs have bonded quite well with the old snowpack. The snowpack will be moist below the tree line.

### Tendency

Moderate, level 2. As a consequence of fresh snow and wind there will be only a slight increase in the avalanche danger, in particular in the south and in the southwest.

## Danger Level 2 - Moderate

**Tendency: Decreasing avalanche danger**  
on Sunday 01 12 2019

### Tendency

Slight decrease in avalanche danger.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Sunday 01 12 2019

Wind-drifted  
snow

Gliding snow

**Fresh wind slabs at high altitude. Slides can occur on steep grassy slopes.**

Individual avalanche prone locations for dry avalanches are to be found in particular on very steep shady slopes above approximately 2200 m, especially adjacent to ridgelines. Such avalanche prone locations are rare and are easy to recognise. Individual gliding avalanches and moist snow slides are possible.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

dp 2: gliding snow

Up to 10 cm of snow. will fall. The snowpack will be in most cases stable. The snowpack will be moist over a wide area. This applies in all aspects below approximately 2000 m as well as on sunny slopes below approximately 2400 m. At low and intermediate altitudes hardly any snow is lying.

## Tendency

Low, level 1.
