Wind-drifted
snow

Treeline

Gliding snow

2600m

Fresh wind slabs require caution.

The fresh wind slabs must be evaluated with care and prudence in all aspects above the tree line. They are prone to triggering. In the regions exposed to a lot of fresh snow this applies in particular in gullies and bowls, and behind abrupt changes in the terrain. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent. Only isolated gliding avalanches are possible, but they can reach medium size, especially in the regions with a lot of snow below approximately 2600 m. Areas with glide cracks are to be avoided as far as possible.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

dp 2: gliding snow

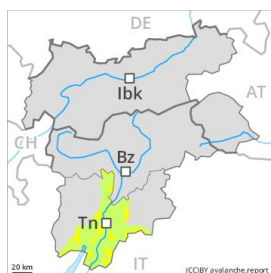

At high altitudes and in high Alpine regions the wind was strong to storm force at times. The wind has transported the fresh and old snow. The fresh wind slabs are clearly recognisable to the trained eye. The sometimes large wind slabs are lying on soft layers. The older wind slabs have bonded quite well with the old snowpack.

The old snowpack will be moist below the tree line.

Tendency

Decrease in avalanche danger.

Danger Level 2 - Moderate

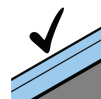

Tendency: Decreasing avalanche danger
on Tuesday 03 12 2019

Wind-drifted
snow

Treeline

Favourable
situation

2000m

Fresh wind slabs above the tree line. The snowpack will be in most cases well bonded.

The mostly small wind slabs can be released by a single winter sport participant in some cases above the tree line.

Gliding avalanches can also be released in the morning on rare occasions.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

The fresh wind slabs are clearly recognisable to the trained eye. They are mostly rather small but can in some cases be released easily. The older wind slabs have bonded quite well with the old snowpack. The snowpack will be stable in particular in shady places that are protected from the wind. In some places fresh snow and wind slabs are lying on an icy crust. Even in moderately steep terrain there is a danger of falling on the icy crust.

Tendency

Slight decrease in avalanche danger.
