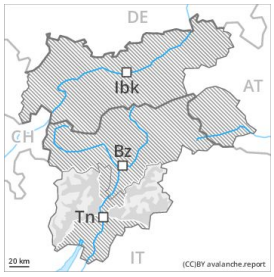
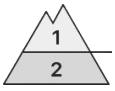
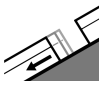
Danger Level 2 - Moderate



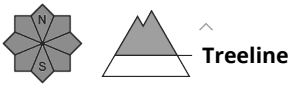


Tendency: Constant avalanche danger
on Saturday 07 12 2019



Gliding snow

Wind-drifted snow



The snowpack will be well bonded in the early morning. Ground avalanches are still possible in particular in the second half of the day in isolated cases. Wind slabs require caution, especially adjacent to ridgelines and in pass areas.

As a consequence of warming during the day and solar radiation individual gliding avalanches are possible, but they can reach medium size, especially at the base of rock walls and on steep grassy slopes below approximately 2400 m. Areas with glide cracks are to be avoided as far as possible. The mostly small wind slabs must be evaluated with care and prudence in all aspects at elevated altitudes. They are easy to recognise but can be released by large loads in particular. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain.

Snowpack

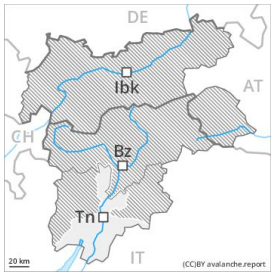
Danger patterns dp 2: gliding snow | dp 6: cold, loose snow and wind

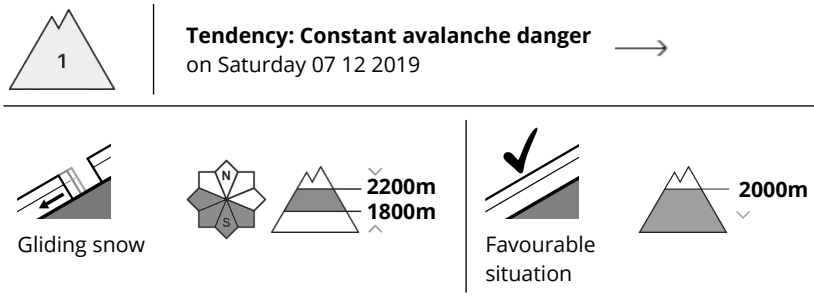
The snowpack will be well bonded in the early morning. Temporary increase in danger of gliding avalanches as a consequence of warming during the day and solar radiation. The wind has transported only a little snow. More recent wind slabs have bonded quite well with the old snowpack in all aspects. These are lying on soft layers in particular on shady slopes above the tree line.

Tendency

Moderate, level 2. Temporary increase in danger of gliding avalanches as a consequence of warming during the day and solar radiation.

Danger Level 1 - Low





In these regions the snowpack is well bonded. Ground avalanches are still possible in particular in the second half of the day, especially on steep grassy slopes.

As a consequence of warming during the day and solar radiation individual gliding avalanches and moist snow slides are possible, but they will be mostly small. The mostly small wind slabs can be released, especially by large additional loads, in all aspects at elevated altitudes. Such avalanche prone locations are rare and are easy to recognise. Even in moderately steep terrain there is a danger of falling on the hard snow surface, after a clear night in particular.

Snowpack

Danger patterns dp 2: gliding snow

The snowpack will be in most cases stable. Over a wide area fresh snow and wind slabs are lying on a hard crust. At low and intermediate altitudes hardly any snow is lying.

Tendency

Low, level 1. Temporary increase in danger of gliding avalanches as a consequence of warming during the day and solar radiation.
