

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Monday 09 12 2019

Gliding snow

In these regions the snowpack is well bonded. Ground avalanches are still possible in the second half of the day, especially on steep grassy slopes.

As a consequence of warming during the day and solar radiation individual gliding avalanches are possible, but they will be mostly small. The small wind slabs can be released, especially by large additional loads, in all aspects at elevated altitudes. Such avalanche prone locations are rare and are easy to recognise. Even in moderately steep terrain there is a danger of falling on the hard snow surface, after a clear night in particular.

## Snowpack

**Danger patterns**

dp 2: gliding snow

The snowpack will be in most cases stable. Over a wide area relatively hard layers of snow are lying on a moist old snowpack. At low and intermediate altitudes hardly any snow is lying.

## Tendency

Low, level 1. Temporary increase in danger of gliding avalanches as a consequence of warming during the day and solar radiation.

 snow

Treeline

Gliding snow

2300m  
 1600m

Caution is to be exercised in areas with glide cracks. Ground avalanches are still possible in particular in the second half of the day in isolated cases.

As a consequence of warming during the day and solar radiation individual gliding avalanches are possible, but they can reach medium size, especially at the base of rock walls and on steep grassy slopes below approximately 2400 m. Areas with glide cracks are to be avoided as far as possible. The mostly small wind slabs have bonded well with the old snowpack in all aspects. They are easy to recognise and can be released by large loads in particular, especially adjacent to ridgelines and in pass areas,, in isolated cases also in gullies and bowls, and behind abrupt changes in the terrain.

## Snowpack

### Danger patterns

dp 2: gliding snow

dp 6: cold, loose snow and wind

The snowpack will be generally stable. The wind has transported only a little snow. The wind slabs are to be found in particular in the vicinity of peaks. These have bonded quite well with the old snowpack in all aspects. Over a wide area relatively hard layers of snow are lying on a moist old snowpack, in particular below the tree line as well as on sunny slopes at intermediate and high altitudes.

## Tendency

Low, level 1. Temporary increase in danger of gliding avalanches as a consequence of warming during the day and solar radiation.
