

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 10 12 2019

Wind-drifted
snow

Treeline

Fresh wind slabs require caution.

The fresh wind slabs must be evaluated with care and prudence in particular on northwest to north to south facing aspects, in particular adjacent to ridgelines. Skiers can release avalanches in some places. Avalanches are rather small. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls. In addition a latent danger of gliding avalanches exists, in particular in case of releases originating from south facing starting zones below approximately 2600 m that have retained the snow thus far.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

The fresh wind slabs remain in some cases prone to triggering. This applies at high altitudes and in high Alpine regions. The old snowpack will be generally well bonded. The surface of the snowpack is frozen, but not to a significant depth. This applies in particular on steep sunny slopes below approximately 2600 m.

Tendency

Strong northwesterly wind. The avalanche danger will persist.
