

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Saturday 22 02 2020

Wind-drifted
snow

2400m

The backcountry touring conditions are favourable over a wide area.

The rather small wind slabs have bonded quite well with the old snowpack. These can only be released by large loads in most cases. The avalanche prone locations are to be found in particular on northwest to north to southeast facing wind-loaded slopes above approximately 2400 m, especially in gullies and bowls, and behind abrupt changes in the terrain. These places are clearly recognisable to the trained eye. In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

The fresh and somewhat older wind slabs are mostly small and can only be released in isolated cases. In some cases relatively hard layers of snow are lying on old snow containing large grains. Faceted weak layers exist deep in the snowpack in particular on shady slopes. The snowpack will be subject to considerable local variations. On south and southwest facing slopes a little snow is lying in all altitude zones.

Tendency

The backcountry touring conditions are generally favourable.
