

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →

on Sunday 08 03 2020

Wind-drifted  
snow

Fresh wind slabs at high altitude. On extremely steep slopes mostly small loose snow avalanches are possible.

As a consequence of fresh snow and a sometimes strong wind from northwesterly directions, wind slabs will form. These can be released by a single winter sport participant in isolated cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2200 m and adjacent to ridgelines. At high altitudes and in high Alpine regions the avalanche prone locations are more prevalent and larger. Such avalanche prone locations are clearly recognisable to the trained eye.

In addition as the day progresses some mostly small loose snow avalanches are possible. On sunny slopes the avalanche prone locations are more prevalent.

## Snowpack

### Danger patterns

dp 6: cold, loose snow and wind

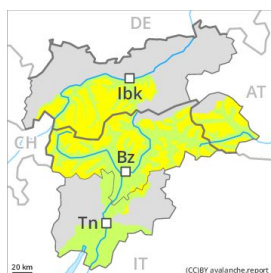

dp 9: graupel blanketed with snow

10 to 20 cm of snow, and even more in some localities, will fall. The northwesterly wind will transport the snow. In some places fresh snow and wind slabs are lying on soft layers. This applies in particular on shady slopes at high altitudes and in high Alpine regions. The no longer entirely fresh wind slabs have bonded quite well with the old snowpack in all aspects. The old snowpack will be generally stable.

## Tendency

The avalanche danger will persist.
