

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Sunday 15 03 2020

Persistent
weak layer

2400m

New snow

1400m

In particular in the southwest and in the southeast some fresh snow above approximately 1200 m.

Over a wide area 15 cm of snow, and even more in some localities, will fall until the evening above approximately 1200 m. It must be evaluated with care and prudence in particular on steep shady slopes. Weak layers exist in the snowpack in particular on steep northeast, north and northwest facing slopes. They can be released in isolated cases, but mostly only by large additional loads, in high Alpine regions. This applies especially above approximately 2400 m and adjacent to ridgelines. These avalanche prone locations are difficult to recognise. As a consequence of the rain, the likelihood of moist and wet avalanches being released will increase a little in particular on steep slopes at low altitude.

Snowpack

In some places fresh snow and wind slabs are lying on a moist old snowpack. The older wind slabs have bonded well with the old snowpack. In very isolated cases weak layers exist in the old snowpack on shady slopes, in particular on shady slopes above approximately 2400 m. At low altitude a little snow is lying.

Tendency

Slight decrease in avalanche danger as the snowfall level drops.

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Sunday 15 03 2020

Wet snow

2000m

New snow

Treeline

Moist and wet avalanches require caution. As a consequence of rain an unfavourable avalanche situation will still be encountered.

Mostly small natural avalanches are possible in particular in steep rocky terrain. As a consequence of the rain, the likelihood of moist and wet avalanches being released will increase for a while in particular on rocky slopes at low and intermediate altitudes. Significant decrease in danger of moist and wet avalanches as the snowfall level drops.

Snowpack

Fresh snow and wind slabs are lying on a wet old snowpack. In some places fresh snow is lying on old snow containing large grains. This applies in particular on shady slopes at high altitudes and in high Alpine regions. At low altitude no snow is lying on south facing slopes.

Tendency

Slight decrease in avalanche danger as the snowfall level drops.
