

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →

on Thursday 30 04 2020

Wind-drifted
snow

The avalanche danger will increase, in the regions exposed to a lot of fresh snow especially.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field.

During the course of the night as a consequence of the snowfall there will be only a slight increase in the avalanche danger to level 2 (moderate). The wind will be light to moderate over a wide area. Adjacent to ridgelines and in gullies and bowls small wind slabs will form. Avalanches are rather small and can be released in isolated cases by a single winter sport participant. As the day progresses the likelihood of avalanches being released will increase a little. The number and size of avalanche prone locations will increase with altitude.

Snowpack

Danger patterns

dp 6: cold, loose snow and wind

In some regions 10 to 20 cm of snow, and even more in some localities, will fall above approximately 2000 m. Individual weak layers exist deep in the old snowpack on steep shady slopes, especially above approximately 2800 m in areas where the snow cover is rather shallow. At low altitude no snow is lying.

Tendency

Slight increase in avalanche danger in particular in the regions exposed to heavier precipitation.
