

## Danger Level 3 - Considerable

**Tendency: Constant avalanche danger** →  
 on Saturday 23 01 2021

Wind-drifted  
 snow

Treeline

Persistent  
 weak layer

Increase in avalanche danger as a consequence of new snow and strong wind. Fresh wind slabs require caution.

Fresh snow and large quantities of wind-drifted snow represent the main danger. The fresh wind slabs can be released easily in all aspects at high altitudes and in high Alpine regions. The avalanche prone locations are sometimes covered with new snow and are difficult to recognise. On wind-loaded slopes natural dry avalanches are possible as the day progresses, in particular medium-sized ones.

Avalanches can in some cases be triggered in deep layers and reach large size. Caution is to be exercised in all aspects also in areas close to the tree line.

Gliding avalanches are possible.

Caution and restraint are important.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.5: snowfall after a long period of cold

Over a wide area 20 to 40 cm of snow, and even more in some localities, will fall. As a consequence of a strong wind from southwesterly directions, further wind slabs will form. The brittle wind slabs are barely recognisable because of the poor visibility. The old snowpack will be in some cases prone to triggering. Whumpfung sounds and the formation of shooting cracks when stepping on the snowpack and field observations confirm poor snowpack stability.

## Tendency

Fresh wind slabs require caution. The avalanche danger will increase but remain within the current danger level.
