

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Sunday 07 03 2021

Wind-drifted
snow

Fresh wind slabs require caution.

As a consequence of new snow and a moderate wind from northerly directions, sometimes avalanche prone wind slabs formed. Caution is to be exercised in particular adjacent to ridgelines in all aspects, as well as on very steep shady slopes above approximately 2000 m. Such avalanche prone locations are clearly recognisable to the trained eye.

In addition a latent danger of gliding avalanches exists. This applies on steep grassy slopes, especially in east, south and west facing starting zones that have retained the snow thus far. Areas with glide cracks are to be avoided.

Dry avalanches can in very isolated cases be released in deeper layers. This applies on extremely steep shady slopes above approximately 2300 m in areas where the snow cover is rather shallow.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

10 to 20 cm of snow, and even more in some localities, has fallen. The new snow and wind slabs will be deposited on soft layers on shady slopes above approximately 2000 m.

The old snowpack will be stable over a wide area. Sunny slopes: New snow and wind slabs are lying on a hard crust.

Isolated avalanche prone weak layers exist in the old snowpack. This applies on shady slopes above approximately 2300 m.

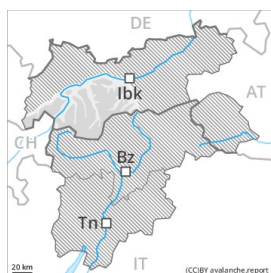

At low and intermediate altitudes hardly any snow is lying.

Tendency

Fresh wind slabs represent the main danger. As a consequence of solar radiation more frequent loose snow avalanches are to be expected, but they will be mostly small.

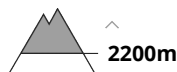

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Sunday 07 03 2021

Wind-drifted
snow

Currently there are generally favourable conditions. Fresh wind slabs adjacent to ridgelines.

As a consequence of new snow and a moderate wind from northerly directions, mostly small wind slabs formed. Caution is to be exercised in particular adjacent to ridgelines. Such avalanche prone locations are clearly recognisable to the trained eye.

In addition a latent danger of gliding avalanches exists. This applies on steep grassy slopes, especially in east, south and west facing starting zones that have retained the snow thus far. Areas with glide cracks are to be avoided.

Dry avalanches can in very isolated cases be released in deeper layers. This applies on extremely steep shady slopes above approximately 2200 m in areas where the snow cover is rather shallow.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

Up to 10 cm of snow will fall. The new snow and wind slabs will be deposited on soft layers on shady slopes above approximately 2000 m.

The old snowpack will be stable over a wide area. Sunny slopes: New snow and wind slabs are lying on a hard crust.

Isolated avalanche prone weak layers exist in the old snowpack. This applies on shady slopes above approximately 2200 m.

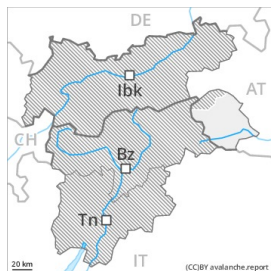

At low and intermediate altitudes only a little snow is lying.

Tendency

Currently there are favourable avalanche conditions. As a consequence of solar radiation loose snow avalanches are possible, but they will be mostly small.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 07 03 2021

Currently there are generally favourable conditions.

Hardly any more gliding avalanches are to be expected, but they can reach medium size in isolated cases. Caution is to be exercised in particular on steep grassy slopes, especially in east, south and west facing starting zones that have retained the snow thus far. Areas with glide cracks are to be avoided. Dry avalanches can additionally in very isolated cases be released in deeper layers. This applies on extremely steep shady slopes above approximately 2200 m in areas where the snow cover is rather shallow.

Main Alpine Ridge: As a consequence of new snow and a moderate northwesterly wind, mostly small wind slabs will form on Friday in particular adjacent to ridgelines.

Snowpack

The snowpack will be stable over a wide area. The surface of the snowpack has frozen to form a strong crust and will hardly soften at all. In steep terrain there is a danger of falling on the hard snow surface. Isolated avalanche prone weak layers exist in the old snowpack. This applies on shady slopes above approximately 2200 m.

At low altitude hardly any snow is lying.

Some snow will fall in the north and in the northeast.

Tendency

Currently there are generally favourable conditions.
