

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 27 03 2021

Wind-drifted
snow

Wind slabs require caution.

As a consequence of a strong northerly wind, sometimes avalanche prone wind slabs formed in the last few days in particular in gullies and bowls and behind abrupt changes in the terrain. This applies in particular on steep west, north and east facing slopes above approximately 2400 m. Avalanches are medium-sized and can be released even by a single winter sport participant. The number and size of avalanche prone locations will increase with altitude. They are easy to recognise.

More loose snow avalanches are possible, in particular on extremely steep sunny slopes.

In steep terrain there is a danger of falling on the hard snow surface. Backcountry touring calls for meticulous route selection.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The fresh and somewhat older wind slabs are lying on soft layers in particular on west to north to east facing aspects above approximately 2400 m. The wind slabs are bonding only slowly with the old snowpack, in particular on shady slopes.

The snowpack will be subject to considerable local variations at high altitudes and in high Alpine regions. Snow depths vary greatly, depending on the influence of the wind. In gullies and bowls, and behind abrupt changes in the terrain a lot of snow is lying.

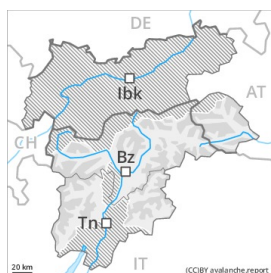

The old snowpack will be stable over a wide area.

Tendency

Wind slabs require caution.

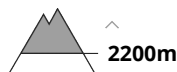

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 27 03 2021

Wind-drifted
snow

Old wind slabs represent the main danger.

The sometimes avalanche-prone wind slabs are to be evaluated with care and prudence in particular on northwest to north to northeast facing aspects. Caution is to be exercised in particular above approximately 2200 m, as well as adjacent to ridgelines and in gullies and bowls. In isolated cases avalanches are medium-sized. At elevated altitudes the avalanche prone locations are more prevalent and larger. These places are easy to recognise.

In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

The sometimes storm force wind has transported the fresh and old snow. The wind slabs are bonding only slowly with the old snowpack, especially on steep, little used shady slopes.

The snowpack will be subject to considerable local variations at high altitudes and in high Alpine regions.

Snow depths vary greatly, depending on the influence of the wind. In gullies and bowls, and behind abrupt changes in the terrain a lot of snow is lying.

The old snowpack will be stable over a wide area.

Tendency

Wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Saturday 27 03 2021

Wind slabs require caution.

As a consequence of a moderate to strong northerly wind, sometimes avalanche prone wind slabs formed in the last few days in particular in gullies and bowls and behind abrupt changes in the terrain. These can be released, especially by large additional loads,. Mostly avalanches are small. The avalanche prone locations are clearly recognisable to the trained eye. The prevalence of such avalanche prone locations will increase with altitude.

In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

The old snowpack will be stable over a wide area. The mostly small wind slabs of the last few days are bonding only slowly with the old snowpack, especially on near-ridge shady slopes.

Snow depths vary greatly, depending on the influence of the wind. On sunny slopes and below the tree line hardly any snow is lying.

Tendency

Some snow will fall on Saturday in some localities. The avalanche danger will persist. Old wind slabs are to be evaluated with care and prudence.
