

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Saturday 08 01 2022

Wind-drifted  
snow

### Fresh wind slabs are to be evaluated with care and prudence.

Fresh wind slabs represent the main danger. As a consequence of new snow and a sometimes strong northerly wind, sometimes avalanche prone wind slabs formed in the last two days above the tree line. Avalanches can in some places be released, even by a single winter sport participant and reach medium size. Avalanche prone locations for dry avalanches are to be found on steep west, north and east facing slopes. At elevated altitudes the avalanche prone locations are present in all aspects. Such avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain, and in gullies and bowls. Wind slabs are clearly recognisable to the trained eye. They are to be bypassed in steep terrain.

Dry avalanches can additionally in very isolated cases be released in deep layers by large loads. This applies in particular on extremely steep shady slopes above approximately 2400 m in areas where the snow cover is rather shallow.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.7: snow-poor zones in snow-rich surrounding

As a consequence of new snow and a moderate to strong northerly wind, sometimes avalanche prone wind slabs formed since Wednesday. In the regions exposed to heavier precipitation the wind slabs are larger. In some places various wind slab layers are lying on soft layers. Shooting cracks when stepping on the snowpack can indicate the danger.

The old snowpack will be subject to considerable local variations. In very isolated cases weak layers exist in the centre of the old snowpack in particular on shady slopes. This applies in particular above approximately 2400 m.

### Tendency

The avalanche danger will persist. Fresh wind slabs require caution.
