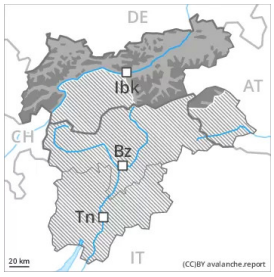
Danger Level 4 - High



Treeline

Tendency: Increasing avalanche danger
on Wednesday 02 02 2022

Outside marked and open pistes a dangerous avalanche situation will be encountered over a wide area.

The danger exists in particular in alpine snow sports terrain. Early and late morning: Large quantities of fresh snow and the wind-drifted snow must be evaluated with care and prudence in all aspects. The extensive wind slabs can be released easily by a single winter sport participant. Individual natural avalanches are possible. This applies in particular on wind-protected north, northeast and east facing slopes, as well as adjacent to ridgelines in all aspects above the tree line. This also applies on very steep shady slopes in areas close to the tree line. At low altitude the avalanche danger is a little lower. As a consequence of a strong to storm force northwesterly wind, further wind slabs will form in the course of the day.
Evening and night: Further increase in avalanche danger as a consequence of new snow and stormy weather.

Snowpack

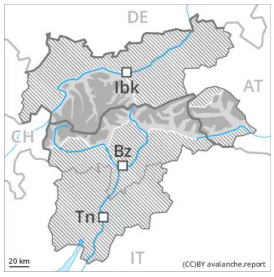
Danger patterns dp.6: cold, loose snow and wind

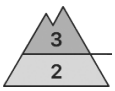
Monday: 30 to 50 cm of snow, and up to 100 cm in some localities, has fallen. Tuesday: 20 to 40 cm of snow, and even more in some localities, will fall. The wind will be strong to storm force. The strong wind will transport the new snow significantly. The fresh wind slabs are lying on soft layers in particular on wind-protected north, northeast and east facing slopes. Isolated avalanche prone weak layers exist in the centre of the old snowpack.

Tendency

As a consequence of rising temperatures, heavy snowfall and the strong to storm force northwesterly wind, a dangerous avalanche situation will develop.

Danger Level 3 - Considerable





Treeline

Tendency: Increasing avalanche danger
on Wednesday 02 02 2022

Fresh wind slabs represent the main danger.

The fresh wind slabs can be released easily by a single winter sport participant. The avalanche prone locations are to be found especially on wind-protected slopes. They are widespread and are barely recognisable because of the poor visibility. As a consequence of new snow and stormy weather the prevalence and size of these avalanche prone locations will increase as the day progresses. In regions neighbouring those that are subject to danger level 4 (high) the avalanche prone locations are more prevalent and the danger is greater.

Snowpack

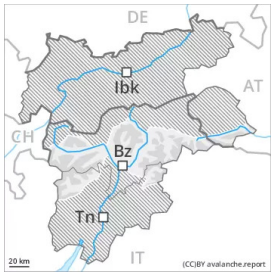
Danger patterns dp.6: cold, loose snow and wind

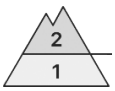
Less snow than expected has fallen in particular in the north. 10 to 30 cm of snow will fall until late in the night. The wind will be strong to storm force. The strong wind will transport the fresh and old snow. The fresh wind slabs are lying on soft layers in particular on steep north, northeast and east facing slopes. The old snowpack will be in most cases stable. At elevated altitudes snow depths vary greatly, depending on the infuence of the wind. In particular on sunny slopes a little snow is lying.

Tendency

The avalanche danger will increase during the day.

Danger Level 2 - Moderate





Treeline

Tendency: Constant avalanche danger
on Wednesday 02 02 2022

Wind slabs require caution.

Wind slabs represent the main danger. Fresh and somewhat older wind slabs can be released by a single winter sport participant in some cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found especially on steep shady slopes and adjacent to ridgelines and in pass areas. Mostly avalanches are small. As a consequence of the strong wind the wind slabs will increase in size additionally. They are to be avoided especially in very steep terrain.
In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

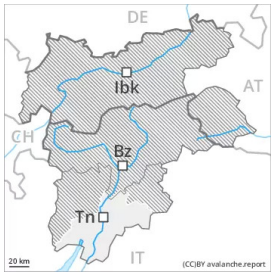
Danger patterns dp.6: cold, loose snow and wind

Some snow will fall. The wind will be strong to storm force. The strong wind will transport the snow. The wind slabs are lying on soft layers in particular on steep shady slopes. The old snowpack will be in most cases stable. At elevated altitudes snow depths vary greatly, depending on the infuence of the wind. Only a small amount of snow is lying for the time of year.

Tendency

The avalanche danger will persist.

Danger Level 1 - Low



Tendency: Constant avalanche danger
on Wednesday 02 02 2022

Wind slabs require caution.

Wind slabs represent the main danger. Fresh and somewhat older wind slabs can be released in isolated cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found especially on steep shady slopes and adjacent to ridgelines and in pass areas. Mostly avalanches are small. As a consequence of the strong wind the wind slabs will increase in size additionally. They are to be avoided especially in very steep terrain.
In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

The wind will be strong to storm force. The strong wind will transport the snow. The wind slabs are lying on soft layers in particular on steep shady slopes. The old snowpack will be in most cases stable. At elevated altitudes snow depths vary greatly, depending on the infuence of the wind. Only a small amount of snow is lying for the time of year.

Tendency

Slight increase in avalanche danger as a consequence of the strong to storm force northwesterly wind.

Danger Level 1 - Low

Wind slabs require caution.

Wind slabs represent the main danger. Fresh and somewhat older wind slabs can be released in isolated cases at high altitudes and in high Alpine regions. The avalanche prone locations are to be found especially on steep shady slopes and adjacent to ridgelines and in pass areas. Mostly avalanches are small. As a consequence of the strong wind the wind slabs will increase in size additionally. They are to be avoided especially in very steep terrain.
In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

Little snow will fall. The wind will be strong to storm force. The strong wind will transport the snow. The wind slabs are lying on soft layers in particular on steep shady slopes. The old snowpack will be in most cases stable. At elevated altitudes snow depths vary greatly, depending on the infuence of the wind. Only a small amount of snow is lying for the time of year.

Tendency

Slight increase in avalanche danger as a consequence of new snow and strong wind.
