

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 03 03 2023

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Currently there are favourable conditions generally. Fresh wind slabs require caution.

Backcountry tourers can release avalanches in some places. The fresh wind slabs are mostly small but can be released in isolated cases. They are to be evaluated with care and prudence in particular on very steep shady slopes and at elevated altitudes.

Avalanches can additionally in very isolated cases be released in the weakly bonded old snow also. These avalanche prone locations are to be found in particular on very steep shady slopes and at transitions from a shallow to a deep snowpack. They are very rare but are difficult to recognise.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In some localities up to 15 cm of snow, and even more in some localities, will fall above approximately 1500 m. The southeasterly wind will transport the new snow. In particular at elevated altitudes mostly small wind slabs will form. In some places new snow and wind slabs are lying on a hard crust.

In very isolated cases weak layers exist in the centre of the snowpack, in particular on steep shady slopes at elevated altitudes.

### Tendency

The backcountry touring conditions remain generally favourable.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 03 03 2023

Currently there are favourable conditions generally. Fresh wind slabs require caution.

Winter sport participants can release avalanches in isolated cases. The fresh wind slabs are mostly small but can be released in isolated cases. They are to be evaluated with care and prudence in particular on very steep shady slopes at elevated altitudes.

Avalanches can additionally in very isolated cases be released in the weakly bonded old snow also. These avalanche prone locations are to be found in particular on very steep shady slopes and at transitions from a shallow to a deep snowpack. They are very rare but are difficult to recognise.

In many places there is a danger of falling on the hard snow surface.

### Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

dp.1: deep persistent weak layer

In some regions up to 10 cm of snow will fall. The southeasterly wind will transport the new snow. In particular at elevated altitudes mostly small wind slabs will form.

In very isolated cases weak layers exist in the centre of the snowpack, in particular on steep shady slopes at elevated altitudes.

### Tendency

The avalanche conditions remain mostly favourable.
