

## Danger Level 3 - Considerable

**Tendency: Increasing avalanche danger**  
 on Friday 21 04 2023

Wind slab

**Treeline**

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow

**Treeline**

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

The new snow and wind slabs of the last few days must be evaluated with care and prudence.

The fresh wind slabs of the last few days can be released easily by a single winter sport participant. Avalanches can in some cases reach medium size. In high Alpine regions the avalanche prone locations are more prevalent. Avalanche prone locations are to be found in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are to be found in particular on very steep shady slopes at elevated altitudes. The wind slabs are to be bypassed as far as possible. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

In very isolated cases weak layers exist in the old snowpack in particular on shady slopes. This applies on very steep slopes above approximately 2200 m.

### Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

Over a wide area 15 to 40 cm of snow, and even more in some localities, will fall until the evening above approximately 1800 m. The fresh and older wind slabs are barely recognisable because of the poor visibility. In some places new snow is lying on soft layers. The fresh snow as well as the wind slabs to be found in particular above approximately 1800 m can be released easily, or, in isolated cases naturally.

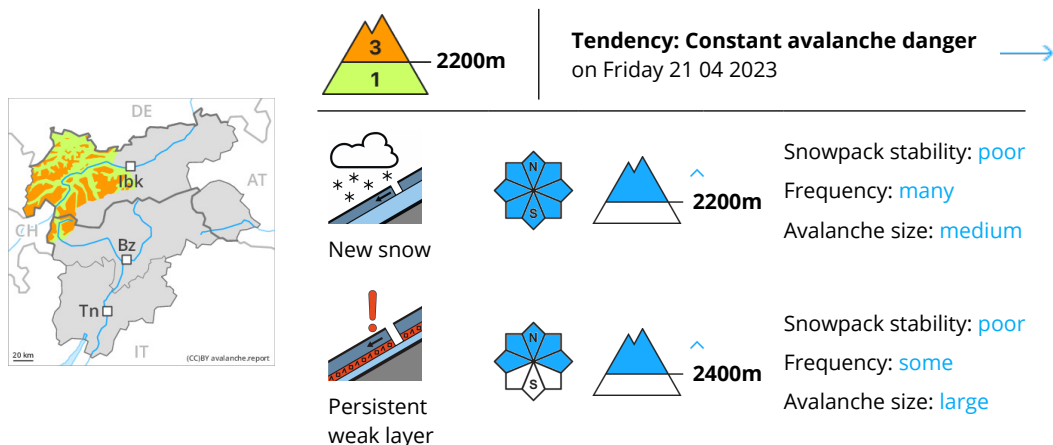

In very isolated cases weak layers exist in the old snowpack in particular on shady slopes. This applies on very steep slopes above approximately 2200 m.

In particular below the tree line only a little snow is lying.

### Tendency

In some regions 10 to 20 cm of snow, and even more in some localities, will fall on Friday above approximately 1800 m. In addition further wind slabs will form in particular adjacent to ridgelines and in gullies and bowls during the night. Increase in avalanche danger as a consequence of the precipitation.

## Danger Level 3 - Considerable

As a consequence of the new snow there will be an increase in the avalanche danger. Weakly bonded old snow is to be avoided.

The new snow can be released by a single winter sport participant. The avalanche prone locations are to be found in particular on steep shady slopes. At high altitudes and in high Alpine regions the avalanche prone locations are present in all aspects. The number and size of avalanche prone locations will increase with altitude. These avalanche prone locations are sometimes covered with new snow and are difficult to recognise. As a consequence of the new snow individual small and, in isolated cases, medium-sized loose snow avalanches are possible.

In isolated cases avalanches can also release deeper layers of the snowpack and reach large size, especially on very steep west, north and east facing slopes above approximately 2400 m. Evening: As the snowfall level rises natural avalanches are possible below approximately 2400 m.

### Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

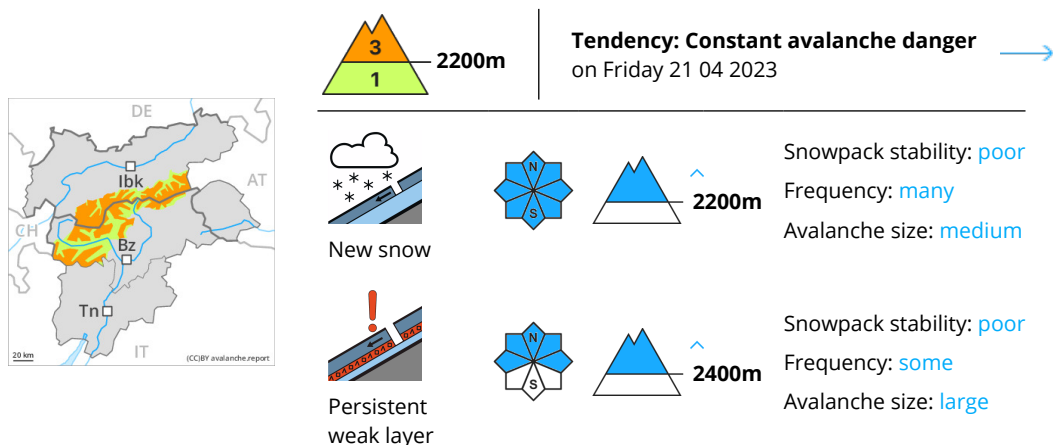

dp.4: cold following warm / warm following cold

Up to 20 cm of snow will fall on Thursday. In some places new snow is lying on soft layers. Faceted weak layers exist in the old snowpack on very steep west, north and east facing slopes, especially above approximately 2400 m on the Main Alpine Ridge.

### Tendency

Hardly any decrease in danger. Some snow will fall.

## Danger Level 3 - Considerable

As a consequence of the new snow there will be an increase in the avalanche danger. Weakly bonded old snow is to be avoided.

The new snow can be released by a single winter sport participant. The avalanche prone locations are to be found in particular on steep shady slopes. At high altitudes and in high Alpine regions the avalanche prone locations are present in all aspects. The number and size of avalanche prone locations will increase with altitude. These avalanche prone locations are sometimes covered with new snow and are difficult to recognise. As a consequence of the new snow individual small and, in isolated cases, medium-sized loose snow avalanches are possible.

In isolated cases avalanches can also release deeper layers of the snowpack and reach large size, especially on very steep west, north and east facing slopes above approximately 2400 m. Evening: As the snowfall level rises natural avalanches are possible below approximately 2400 m.

### Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

dp.4: cold following warm / warm following cold

20 to 30 cm of snow, and up to 40 cm in some localities, will fall on Thursday. In some places new snow is lying on soft layers.

Faceted weak layers exist in the old snowpack on very steep west, north and east facing slopes, especially above approximately 2400 m on the Main Alpine Ridge.

### Tendency

Hardly any decrease in danger. Some snow will fall.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 21 04 2023

Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

### Fresh wind slabs require caution.

The fresh wind slabs can be released in isolated cases in particular on steep shady slopes above the tree line. In very isolated cases avalanches are medium-sized. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

5 to 15 cm of snow, and even more in some localities, will fall on Thursday. In isolated cases wind slabs are lying on soft layers, in particular on steep shady slopes at elevated altitudes. At low and intermediate altitudes only a little snow is now lying.

### Tendency

Slight increase in avalanche danger as a consequence of the snowfall.

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
on Friday 21 04 2023

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

The new snow and wind slabs of the last few days must be evaluated with care and prudence.

### Snowpack

**Danger patterns**

dp.6: cold, loose snow and wind

dp.4: cold following warm / warm following cold

Up to 20 cm of snow will fall on Thursday. In some places new snow is lying on a weakly bonded old snowpack.

Faceted weak layers exist in the old snowpack on very steep west, north and east facing slopes, especially above approximately 2400 m on the Main Alpine Ridge.

### Tendency

Hardly any decrease in danger.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 21 04 2023

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

### New snow and wind slabs require caution.

The fresh wind slabs can be released in isolated cases. The avalanche prone locations are to be found in particular on very steep shady slopes at elevated altitudes, especially at transitions into gullies and bowls. Mostly avalanches are only small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

The fresh snow as well as the wind slabs to be found in particular above approximately 2000 m can be released easily, or, in isolated cases naturally. Soft wind slabs can be released easily especially at their margins. The fresh and older wind slabs are barely recognisable because of the poor visibility. In isolated cases wind slabs are lying on soft layers, in particular on steep shady slopes at elevated altitudes. In particular below the tree line only a little snow is lying.

### Tendency

Over a wide area wind and new snow above approximately 1800 m. Slight increase in avalanche danger as a consequence of the snowfall.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 21 04 2023

Wind slab

Treeline

Snowpack stability: **poor**

Hardly any decrease in danger. Some snow will fall.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Friday 21 04 2023

Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

### Fresh wind slabs are to be avoided.

The fresh wind slabs can be released by a single winter sport participant in isolated cases. The avalanche prone locations are to be found in particular on very steep shady slopes above approximately 1600 m, especially at transitions into gullies and bowls. In very isolated cases avalanches are medium-sized.

### Snowpack

#### Danger patterns

dp.6: cold, loose snow and wind

The snowpack will be quite well bonded. In isolated cases wind slabs are lying on soft layers, in particular on steep shady slopes. At low altitude only a little snow is now lying.

### Tendency

Gradual decrease in avalanche danger.
