

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
 on Friday 22 12 2023

Wind slab

2400m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Gliding snow

2400m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

**Fresh wind slabs require caution. Gliding snow represents the main danger.**

The fresh wind slabs are in isolated cases prone to triggering especially on very steep shady slopes above approximately 2400 m. These can especially at their margins be released by a single winter sport participant and reach medium size. The avalanche prone locations are easy to recognise. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain.

A certain danger of gliding avalanches exists. This applies on steep east, south and west facing slopes below approximately 2400 m. Areas with glide cracks are to be avoided as far as possible.

Weak layers in the old snowpack can be released especially by large additional loads in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Avalanche prone locations are to be found on very steep shady slopes above approximately 2200 m. These places are very rare but are difficult to recognise. Avalanches can reach large size in isolated cases.

## Snowpack

### Danger patterns

dp.2: gliding snow

dp.6: cold, loose snow and wind

The weather conditions gave rise to increasing consolidation of the snowpack. The fresh and somewhat older wind slabs are lying on soft layers in particular on near-ridge shady slopes at high altitudes and in high Alpine regions. This applies in particular on shady slopes. Towards its base, the snowpack is faceted. The snowpack will be generally subject to considerable local variations.

Low and intermediate altitudes: Towards its base, the snowpack is moist.

Evening and first half of night: Over a wide area 10 to 20 cm of snow, and even more in some localities, will fall above approximately 1800 m.

## Tendency

Over a wide area 40 to 80 cm of snow, and even more in some localities, will fall on Friday above approximately 1800 m. During the day: Significant increase in avalanche danger as a consequence of new snow and stormy weather. On wind-loaded slopes more frequent natural avalanches are to be expected as the day progresses, even large ones in isolated cases. Gliding avalanches are also to be expected, in particular on steep grassy slopes below approximately 2400 m.

## Danger Level 2 - Moderate

**Tendency: Increasing avalanche danger**  
on Friday 22 12 2023

Wind slab

2400m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

A quite favourable avalanche situation will prevail. Wind slabs require caution.

The fresh and older wind slabs are in some cases still prone to triggering above approximately 2400 m. Wind slabs can in isolated cases be released by a single winter sport participant and reach medium size. Caution is to be exercised in particular adjacent to ridgelines and in gullies and bowls.

Weak layers in the old snowpack can be released in very isolated cases in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. This applies on very steep shady slopes above approximately 2400 m. The avalanche prone locations are very rare but are barely recognisable.

In the regions with a lot of snow gliding avalanches are possible.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.7: snow-poor zones in snow-rich surrounding

The wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes. Faceted weak layers exist in the centre of the snowpack in particular above approximately 2400 m. The weather conditions gave rise to increasing consolidation of the snowpack.  
Evening and first half of night: Some snow will fall in some localities.

## Tendency

In particular in the north 25 to 50 cm of snow, and even more in some localities, will fall above approximately 1800 m. As the day progresses as a consequence of new snow and stormy weather there will be an appreciable increase in the avalanche danger. The large quantity of fresh snow and in particular the extensive wind slabs represent the main danger. Gliding snow requires caution.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Friday 22 12 2023

Wind slab

2400m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

A generally favourable avalanche situation will prevail. Wind slabs require caution.

The wind slabs are in individual cases still prone to triggering in particular on very steep shady slopes above approximately 2400 m. The mostly small wind slabs are clearly recognisable to the trained eye. Caution is to be exercised in particular adjacent to ridgelines and in gullies and bowls.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

The wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes. The weather conditions will give rise to increasing consolidation of the snowpack.

Evening and night: Some snow will fall in some localities.

## Tendency

In particular in the north 10 to 20 cm of snow, and even more in some localities, will fall on Friday above approximately 1800 m. As the day progresses as a consequence of new snow and stormy weather there will be an increase in the avalanche danger. Fresh wind slabs require caution.
