

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
 on Sunday 07 01 2024

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wind slabs require caution.

The new snow and wind slabs of the last few days must be evaluated with care and prudence in all aspects above the tree line. As a consequence of the strong wind, fresh snow drift accumulations will form. These avalanche prone locations are to be found in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example and on wind-loaded slopes. The new snow and wind slabs can be released by a single winter sport participant in isolated cases. In particular above the tree line these avalanche prone locations are more widespread.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

Over a wide area over a wide area 20 to 30 cm of snow, and even more in some localities, has fallen. 10 to 20 cm of snow will fall on Saturday above approximately 1000 m. The wind will be moderate to strong in some localities. Snow depths vary greatly above the tree line, depending on the influence of the wind. The fresh wind slabs are bonding poorly with the old snowpack in all aspects and above the tree line.

Tendency

The wind will be strong over a wide area. New snow and wind slabs require caution.

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Sunday 07 01 2024

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Slight increase in avalanche danger in the course of the day. Fresh wind slabs require caution.

As a consequence of new snow and a strengthening wind, sometimes avalanche prone wind slabs will form in the afternoon above the tree line. Caution is to be exercised in particular adjacent to ridgelines in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are barely recognisable because of the poor visibility.

In addition a latent danger of gliding avalanches exists, in particular on steep east, south and west facing slopes below approximately 2600 m. In isolated cases the gliding avalanches are quite large. This applies in the regions with a lot of snow. Caution is to be exercised in areas with glide cracks.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

Over a wide area 10 to 30 cm of snow will fall. Afternoon: The wind will be moderate in some regions. The fresh wind slabs are lying on soft layers at elevated altitudes. They can in some cases be released easily.

The new snow will be deposited on surface hoar in some places in areas close to the tree line. The new snow of the last few days is lying on a crust in all aspects below approximately 2600 m. The old snowpack will be stable over a wide area.

Tendency

Increase in avalanche danger as a consequence of new snow and wind. Over a wide area 20 to 40 cm of snow, and even more in some localities, will fall until Sunday above approximately 1000 m. The fresh wind slabs can be released easily.

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Sunday 07 01 2024

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wind slabs require caution.

The new snow and wind slabs of the last few days must be evaluated with care and prudence in all aspects above the tree line. As a consequence of the strong wind, fresh snow drift accumulations will form. These avalanche prone locations are to be found in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example and on wind-loaded slopes. The new snow and wind slabs can be released by a single winter sport participant in isolated cases. In particular above the tree line these avalanche prone locations are more widespread.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

Over a wide area over a wide area 20 to 30 cm of snow, and even more in some localities, has fallen. 10 to 20 cm of snow will fall on Saturday above approximately 1300 m. The wind will be moderate to strong in some localities. Snow depths vary greatly above the tree line, depending on the influence of the wind. The fresh wind slabs are bonding poorly with the old snowpack in all aspects and above the tree line. At low and intermediate altitudes only a little snow is lying.

Tendency

The wind will be strong over a wide area. New snow and wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 07 01 2024

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

The avalanche danger will increase a little during the day. Fresh wind slabs require caution.

As a consequence of new snow and a strengthening wind, mostly small wind slabs will form in the afternoon above the tree line. These can be released in isolated cases. Caution is to be exercised in particular adjacent to ridgelines in gullies and bowls, and behind abrupt changes in the terrain. The avalanche prone locations are barely recognisable because of the poor visibility. In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

10 to 30 cm of snow will fall above approximately 1000 m. Evening and first half of night: The wind will be moderate in some regions. The new snow and wind slabs will be deposited on a crust in particular on sunny slopes at high altitude.

Tendency

Fresh wind slabs require caution.
