

Danger Level 3 - Considerable

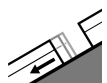

Tendency: Decreasing avalanche danger
 on Tuesday 30 01 2024

Persistent weak layer

Snowpack stability: **poor**
 Frequency: **some**
 Avalanche size: **large**

Gliding snow

Snowpack stability: **very poor**
 Frequency: **few**
 Avalanche size: **medium**

Wind slab

Snowpack stability: **fair**
 Frequency: **few**
 Avalanche size: **small**

Weak layers in the upper part of the snowpack necessitate caution and restraint. In addition a latent danger of gliding avalanches exists.

Weak layers in the upper part of the snowpack can be released in some places by individual winter sport participants. This applies in particular on very steep sunny slopes above approximately 2600 m. Whumpfung sounds and the formation of shooting cracks when stepping on the snowpack serve as an alarm indicating the danger. In some cases the avalanches are large.

Somewhat older wind slabs can still be released in some cases in particular on very steep shady slopes above approximately 2600 m. Caution is to be exercised in particular adjacent to ridgelines in high Alpine regions.

More gliding avalanches are possible, even large ones in isolated cases. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns

dp.4: cold following warm / warm following cold

dp.2: gliding snow

High altitudes and the high Alpine regions:

The northwesterly wind has transported a lot of snow. Faceted weak layers exist in the top section of the snowpack, in particular on very steep sunny slopes above approximately 2600 m. Field observations and released avalanches indicate the existence of a weak snowpack. Towards its base, the snowpack is largely stable.

Low and intermediate altitudes:

The old snowpack is wet and its surface has a melt-freeze crust that is strong in many cases. The high

temperatures as the day progresses will give rise to slight moistening of the snowpack. This applies on very steep sunny slopes.

Tendency

The avalanche danger will decrease gradually. Weak layers in the upper part of the snowpack necessitate caution. In addition a latent danger of gliding avalanches exists.

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
 on Tuesday 30 01 2024

Persistent weak layer

2600m

Snowpack stability: **poor**
 Frequency: **few**
 Avalanche size: **medium**

Gliding snow

2600m

Snowpack stability: **very poor**
 Frequency: **few**
 Avalanche size: **medium**

Wind slab

2600m

Snowpack stability: **fair**
 Frequency: **few**
 Avalanche size: **small**

Weak layers in the upper part of the snowpack necessitate caution. In addition a latent danger of gliding avalanches exists.

Weak layers in the upper part of the snowpack can be released in isolated cases by winter sport participants. This applies in particular on very steep sunny slopes above approximately 2600 m. In isolated cases the avalanches are large.

Somewhat older wind slabs can still be released in some cases in particular on very steep shady slopes above approximately 2600 m. Caution is to be exercised in particular adjacent to ridgelines in high Alpine regions.

More gliding avalanches are possible, even large ones in isolated cases. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns

dp.4: cold following warm / warm following cold

dp.2: gliding snow

High altitudes and the high Alpine regions:

The northwesterly wind has transported a lot of snow. Faceted weak layers exist in the top section of the snowpack, in particular on very steep sunny slopes above approximately 2600 m. Field observations and released avalanches indicate the existence of a weak snowpack. Towards its base, the snowpack is largely stable.

Low and intermediate altitudes:

The old snowpack is wet and its surface has a melt-freeze crust that is strong in many cases. The high temperatures as the day progresses will give rise to slight moistening of the snowpack. This applies on very

steep sunny slopes.

Tendency

The avalanche danger will decrease gradually. Weak layers in the upper part of the snowpack necessitate caution. In addition a latent danger of gliding avalanches exists.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Tuesday 30 01 2024

Gliding snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Wind slab

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **medium**

Gliding snow represents the main danger.

More gliding avalanches are possible, even large ones in isolated cases. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

In addition the wind slabs of the last few days are prone to triggering in isolated cases still, in particular on very steep shady slopes above approximately 2600 m adjacent to ridgelines.

Snowpack

Danger patterns

dp.2: gliding snow

dp.6: cold, loose snow and wind

High altitudes and the high Alpine regions: The no longer entirely fresh wind slabs are lying on soft layers on shady slopes above approximately 2600 m. Towards its base, the snowpack is largely stable.

Low and intermediate altitudes: The old snowpack is wet and its surface has a melt-freeze crust that is strong in many cases. The high temperatures as the day progresses will give rise to slight moistening of the snowpack. This applies on very steep sunny slopes.

Tendency

The conditions are generally favourable.

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Tuesday 30 01 2024

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

The conditions are favourable over a wide area.

As a consequence of a sometimes strong wind from northwesterly directions, sometimes avalanche prone wind slabs formed. They are to be found in particular on northwest to north to northeast facing aspects above approximately 2600 m. Caution is to be exercised in particular on very steep slopes adjacent to ridgelines. Avalanches can reach medium size in isolated cases.

Only isolated gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

High altitudes and the high Alpine regions:

The somewhat older wind slabs are lying on soft layers at elevated altitudes. They are in individual cases still prone to triggering.

Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

Intermediate and high altitudes: Early and late morning: The snowpack is wet and its surface has a melt-freeze crust that is strong in many cases, in particular on sunny slopes. During the day: The high temperatures will give rise to slight moistening of the snowpack, in particular on sunny slopes.

Tendency

The backcountry touring conditions are spring-like.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 30 01 2024

Wind slab

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

The conditions are favourable over a wide area.

The no longer entirely fresh wind slabs can be released in isolated cases, but mostly only by large additional loads,, especially at their margins. They are to be found in particular on northwest to north to northeast facing aspects above approximately 2600 m. Caution is to be exercised in particular on very steep slopes adjacent to ridgelines. Mostly avalanches are small.

Only isolated gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

High altitudes and the high Alpine regions:

The somewhat older wind slabs are lying on soft layers at elevated altitudes. They are in individual cases still prone to triggering.

Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

Intermediate and high altitudes: Early and late morning: The snowpack is wet and its surface has a melt-freeze crust that is strong in many cases, in particular on sunny slopes. During the day: The high temperatures will give rise to slight moistening of the snowpack, in particular on sunny slopes.

Tendency

The backcountry touring conditions are spring-like.
