

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 06 02 2024

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

A latent danger of gliding avalanches exists. Fresh wind slabs require caution.

Individual gliding avalanches are possible, even medium-sized ones. Areas with glide cracks are to be avoided. This applies in particular on steep grassy slopes below approximately 2600 m.

At elevated altitudes small wind slabs will form. They can be released in isolated cases. Individual avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2600 m. Individual wet loose snow avalanches are possible, but they will be mostly small, in particular on extremely steep sunny slopes.

Snowpack

Danger patterns

dp.2: gliding snow

dp.6: cold, loose snow and wind

Faceted weak layers exist in the top section of the snowpack, in particular on very steep sunny slopes above approximately 2600 m. Towards its base, the snowpack is largely stable.

Low and intermediate altitudes: The old snowpack is moist and its surface has a melt-freeze crust that is strong in many cases.

Tendency

A latent danger of gliding avalanches exists. Fresh wind slabs require caution.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 06 02 2024

Low avalanche danger will prevail. The conditions are favourable over a wide area.

Wind slabs are in individual cases still prone to triggering. Individual avalanche prone locations are to be found on very steep shady slopes above approximately 2600 m. This applies in particular adjacent to ridgelines.

Only isolated gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided. Individual moist avalanches are possible, but they will be mostly small, in particular on extremely steep sunny slopes.

Snowpack

The snowpack will be in most cases stable.

Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

Intermediate and high altitudes: Early and late morning: The old snowpack is moist and its surface has a melt-freeze crust that is strong in many cases. Sunshine and high temperatures will give rise as the day progresses to slight moistening of the snowpack in particular on very steep sunny slopes.

Tendency

The avalanche conditions are favourable over a wide area. The wind will be moderate to strong in some cases.
