

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →

on Thursday 08 02 2024

Low avalanche danger will prevail. The conditions are favourable over a wide area.

Wind slabs are in individual cases still prone to triggering. Individual avalanche prone locations are to be found on very steep shady slopes above approximately 2600 m. This applies in particular adjacent to ridgelines.

Only isolated gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided. Individual moist and wet avalanches are possible, but they will be mostly small, in particular on extremely steep sunny slopes.

### Snowpack

The snowpack will be in most cases stable.

Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

Intermediate and high altitudes: The old snowpack is moist and its surface has a melt-freeze crust that is strong in many cases. Sunshine and high temperatures will give rise as the day progresses to increasing softening of the snowpack in particular on very steep sunny slopes.

### Tendency

The avalanche conditions are favourable over a wide area.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →

on Thursday 08 02 2024

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

### A latent danger of gliding avalanches exists.

Individual gliding avalanches are possible, in particular medium-sized ones. Areas with glide cracks are to be avoided. This applies in particular on steep grassy slopes below approximately 2600 m.

At elevated altitudes small wind slabs will form. Individual avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2600 m. Individual wet loose snow avalanches are possible, but they will be mostly small.

## Snowpack

### Danger patterns

dp.2: gliding snow

The sometimes strong wind will transport only a little snow. The snowpack is largely stable.

Intermediate and high altitudes: The old snowpack is moist and its surface has a melt-freeze crust that is strong in many cases.

## Tendency

A latent danger of gliding avalanches exists.
