

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 09 02 2024

Wind slab

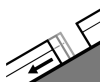

2400m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Gliding snow

2600m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Fresh wind slabs require caution. A latent danger of gliding avalanches exists.

At elevated altitudes small wind slabs will form. Individual avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2400 m.

Individual gliding avalanches are possible, in particular medium-sized ones. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

## Snowpack

### Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

Up to 10 cm of snow will fall above approximately 1500 m. The strong wind will transport the new snow. The old snowpack is largely stable.

## Tendency

Fresh wind slabs require caution. A latent danger of gliding avalanches exists.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Friday 09 02 2024

### Low avalanche danger will prevail.

Wind slabs are in individual cases still prone to triggering. Individual avalanche prone locations are to be found on very steep shady slopes above approximately 2600 m. This applies in particular adjacent to ridgelines.

Individual gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided. Individual moist avalanches are possible, but they will be mostly small, in particular on extremely steep sunny slopes.

### Snowpack

The snowpack will be in most cases stable. Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

### Tendency

Over a wide area 20 to 50 cm of snow, and even more in some localities, will fall on Friday above approximately 1500 m. Increase in avalanche danger as a consequence of new snow and wind.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Friday 09 02 2024

Low avalanche danger will prevail. The conditions are favourable over a wide area.

At elevated altitudes small wind slabs will form. Fresh and somewhat older wind slabs are in individual cases still prone to triggering. Individual avalanche prone locations are to be found on very steep shady slopes above approximately 2600 m. This applies in particular adjacent to ridgelines.

Only isolated gliding avalanches are possible, in particular on steep east, south and west facing slopes below approximately 2600 m. Areas with glide cracks are to be avoided. Individual moist and wet avalanches are possible, but they will be mostly small, in particular on extremely steep sunny slopes.

### Snowpack

Some snow will fall in some localities, in particular in the north. The moderate wind will transport only a little snow. The snowpack will be in most cases stable.

Towards its base, the snowpack consists of faceted crystals. The snowpack will be subject to considerable local variations above the tree line.

Intermediate and high altitudes: The old snowpack is moist and its surface has a melt-freeze crust that is strong in many cases. Sunshine and high temperatures will give rise as the day progresses to increasing softening of the snowpack in particular on very steep sunny slopes.

### Tendency

In some regions 5 to 15 cm of snow, and even more in some localities, will fall on Friday. Increase in avalanche danger as a consequence of new snow and strong wind.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →
