

Danger Level 3 - Considerable

Tendency: Increasing avalanche danger
 on Saturday 30 03 2024

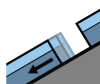

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

A precarious avalanche situation will persist in some cases. Fresh wind slabs are to be evaluated critically.

As a consequence of a strong to storm force wind, further wind slabs will form. These can be released even by a single winter sport participant in particular on very steep west, north and southeast facing slopes. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2200 m. The prevalence of avalanche prone locations and likelihood of triggering will increase with altitude.

Isolated natural avalanches are possible. This applies in particular on very steep shady slopes adjacent to ridgelines especially in high Alpine regions. Mostly avalanches are medium-sized.

On steep grassy slopes more medium-sized gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2600 m, including on steep shady slopes below approximately 2200 m. Areas with glide cracks are to be avoided.

As a consequence of warming during the day more frequent moist loose snow avalanches are to be expected. This applies on extremely steep slopes in all aspects, in the event of prolonged bright spells especially.

Backcountry touring calls for extensive experience and a certain restraint.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

25 to 40 cm of snow, and even more in some localities, has fallen since Wednesday. Some snow will fall on Friday in some localities.

The wind will be strong to storm force. Fresh and somewhat older wind slabs are lying on soft layers in particular on west to north to southeast facing aspects at elevated altitudes. The high temperatures as the day progresses will give rise to increasing moistening of the snowpack.

Tendency

From midday as a consequence of new snow and strong wind there will be an increase in the avalanche danger within the current danger level. 15 to 30 cm of snow will fall. Fresh wind slabs represent the main danger. Gliding snow requires caution.

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
on Saturday 30 03 2024

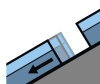

Wind slab

Snowpack stability: **poor**

Frequency: **many**

Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Fresh wind slabs are to be evaluated critically.

As a consequence of a strong to storm force wind, further wind slabs will form. These can be released even by a single winter sport participant in particular on very steep northwest, north and east facing slopes. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2200 m. The prevalence of avalanche prone locations and likelihood of triggering will increase with altitude.

On steep grassy slopes more medium-sized gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2600 m, including on steep shady slopes below approximately 2200 m. Areas with glide cracks are to be avoided.

As a consequence of warming during the day more frequent moist loose snow avalanches are to be expected. This applies on extremely steep slopes in all aspects, in the event of prolonged bright spells especially.

Backcountry touring calls for experience and a certain restraint.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

15 to 30 cm of snow, and even more in some localities, has fallen since Wednesday. Some snow will fall on Friday in some localities.

The wind will be strong to storm force. Fresh and somewhat older wind slabs are lying on soft layers in particular on northwest to north to east facing aspects at elevated altitudes. The high temperatures as the day progresses will give rise to increasing moistening of the snowpack.

Tendency

From midday as a consequence of new snow and strong wind there will be only a slight increase in the

avalanche danger. Fresh wind slabs represent the main danger. Gliding snow requires caution.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Saturday 30 03 2024

Gliding snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Gliding snow requires caution.

On steep grassy slopes medium-sized gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2600 m, including on steep shady slopes below approximately 2200 m. Avalanches can reach medium size. Areas with glide cracks are to be avoided.

As the day progresses more frequent moist loose snow slides are to be expected.

The fresh wind slabs are mostly small and unlikely to be released now. Individual avalanche prone locations are to be found on very steep shady slopes above approximately 2400 m. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack

Danger patterns

dp.2: gliding snow

5 to 15 cm of snow has fallen since Wednesday.

The wind will be strong to storm force. Fresh wind slabs are lying on soft layers on shady slopes at elevated altitudes.

The high temperatures as the day progresses will give rise to increasing moistening of the snowpack.

Tendency

The weather conditions will give rise to moistening of the snowpack.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
 on Saturday 30 03 2024

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Gliding snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

Wind slabs and gliding snow require caution.

As a consequence of a strong to storm force wind, further wind slabs will form. These can be released even by a single winter sport participant in particular on very steep shady slopes. Caution is to be exercised in particular in gullies and bowls, and behind abrupt changes in the terrain above approximately 2400 m. The prevalence of avalanche prone locations and likelihood of triggering will increase with altitude.

On steep grassy slopes more medium-sized and, in isolated cases, large gliding avalanches are possible. This applies especially on steep sunny slopes below approximately 2600 m, including on steep shady slopes below approximately 2200 m. Areas with glide cracks are to be avoided.

As a consequence of warming during the day more frequent moist loose snow avalanches are to be expected. This applies on extremely steep slopes in all aspects, in the event of prolonged bright spells especially.

Backcountry touring calls for experience and a certain restraint.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

dp.2: gliding snow

5 to 20 cm of snow, and even more in some localities, has fallen since Wednesday.

The wind will be strong to storm force. Fresh and somewhat older wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes. The high temperatures as the day progresses will give rise to increasing moistening of the snowpack.

Tendency

Fresh wind slabs represent the main danger. Gliding snow requires caution.
