

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger

on Wednesday 17 04 2024

Gliding snow

2600m

Frequency: **some**

Avalanche size: **medium**

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **medium**

Until midday the weather will be mild over a wide area. Wet and gliding snow are to be critically assessed.

On steep grassy slopes more medium-sized and, in isolated cases, large gliding avalanches are possible below approximately 2600 m. Areas with glide cracks are to be avoided.

In the early morning more medium-sized moist and wet avalanches are possible. This applies on steep, rather lightly snow-covered slopes in particular below approximately 2600 m.

In isolated cases wet avalanches can release the saturated snowpack and reach large size. In steep gullies avalanches can in isolated cases reach valley bottoms at relatively high altitudes.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.2: gliding snow

The snowpack will be wet all the way through. This applies on sunny slopes in all altitude zones, as well as on shady slopes below approximately 2600 m. The surface of the snowpack will only just freeze and will already be soft in the early morning.

Tendency

Wednesday: Sharp decrease in danger of wet avalanches as the temperature drops.

Danger Level 1 - Low

Tendency: Decreasing avalanche danger
on Wednesday 17 04 2024

Until midday the weather will be very mild. The danger of wet avalanches will already exist in the early morning.

On steep grassy slopes mostly small gliding avalanches are possible. From the middle of the day the activity of wet avalanches will gradually decrease.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.2: gliding snow

The surface of the snowpack will freeze very little and will already be soft in the early morning.

Below approximately 1800 m from a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Wednesday: The avalanche danger will decrease.
